## MEDIA HUB FOR THE MOOVE DIRECTION SKOLKOVO x MTS

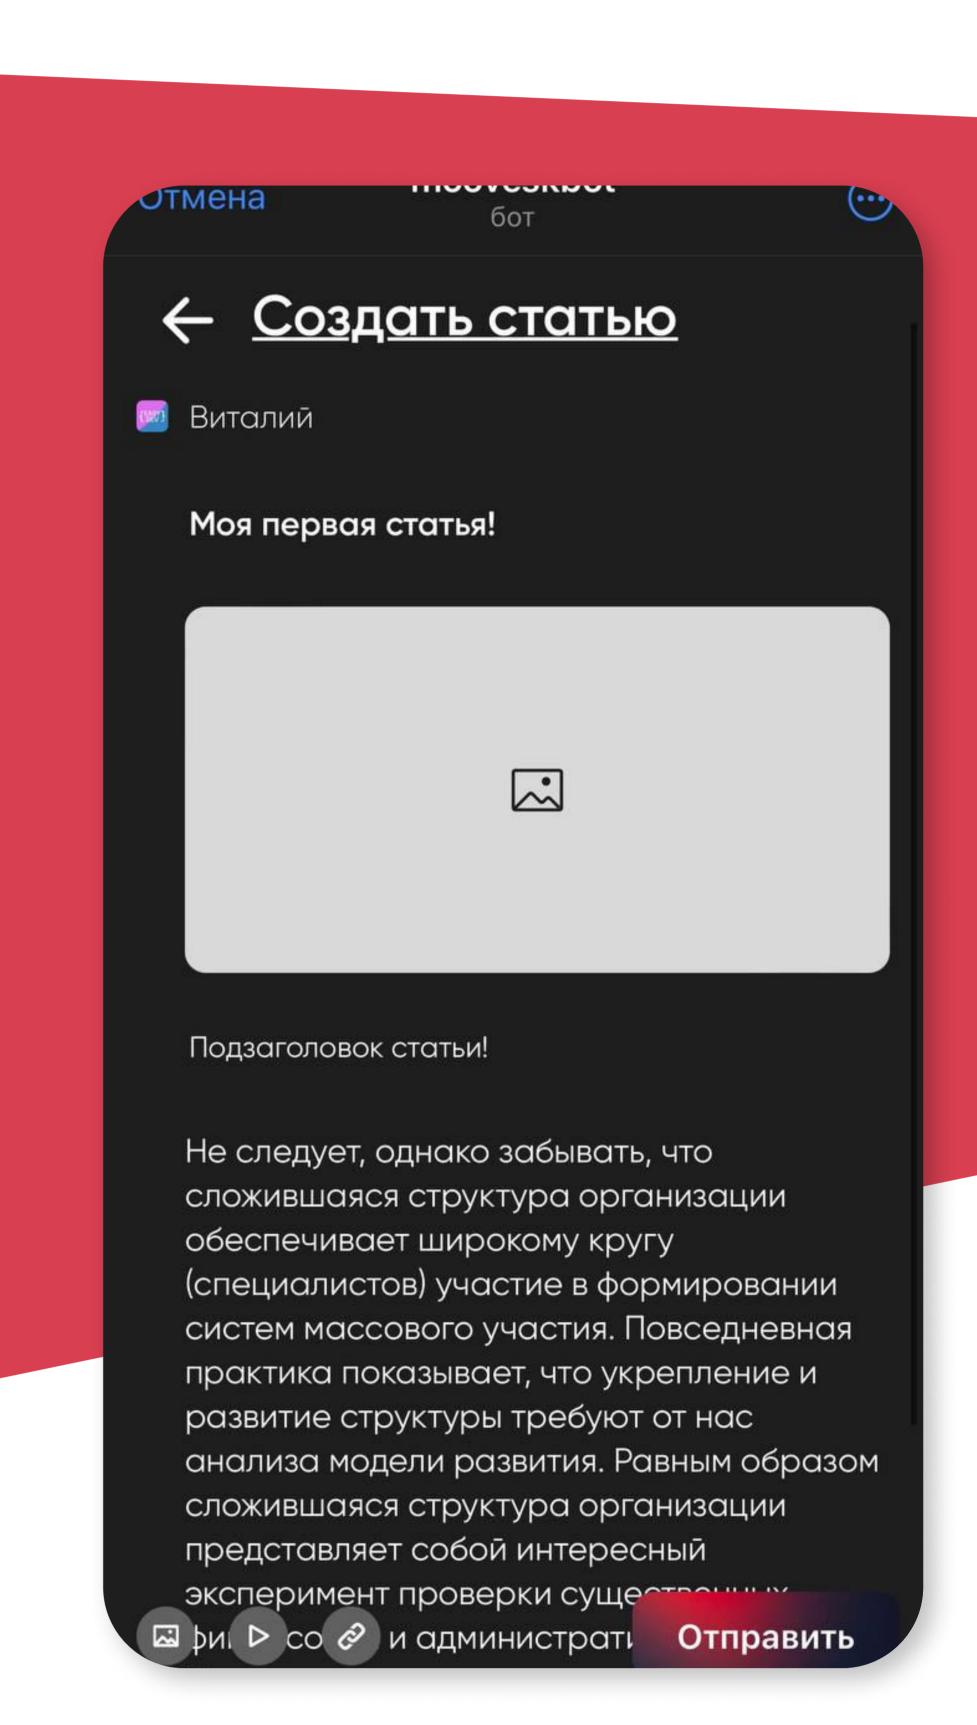

Our task was to develop an intuitive and simple communication application for students of the MOOVE direction in Skolkovo, where they could share their knowledge and achievements in the form of articles, gain popularity, get educated and find new useful acquaintances in the field in which they are developing.

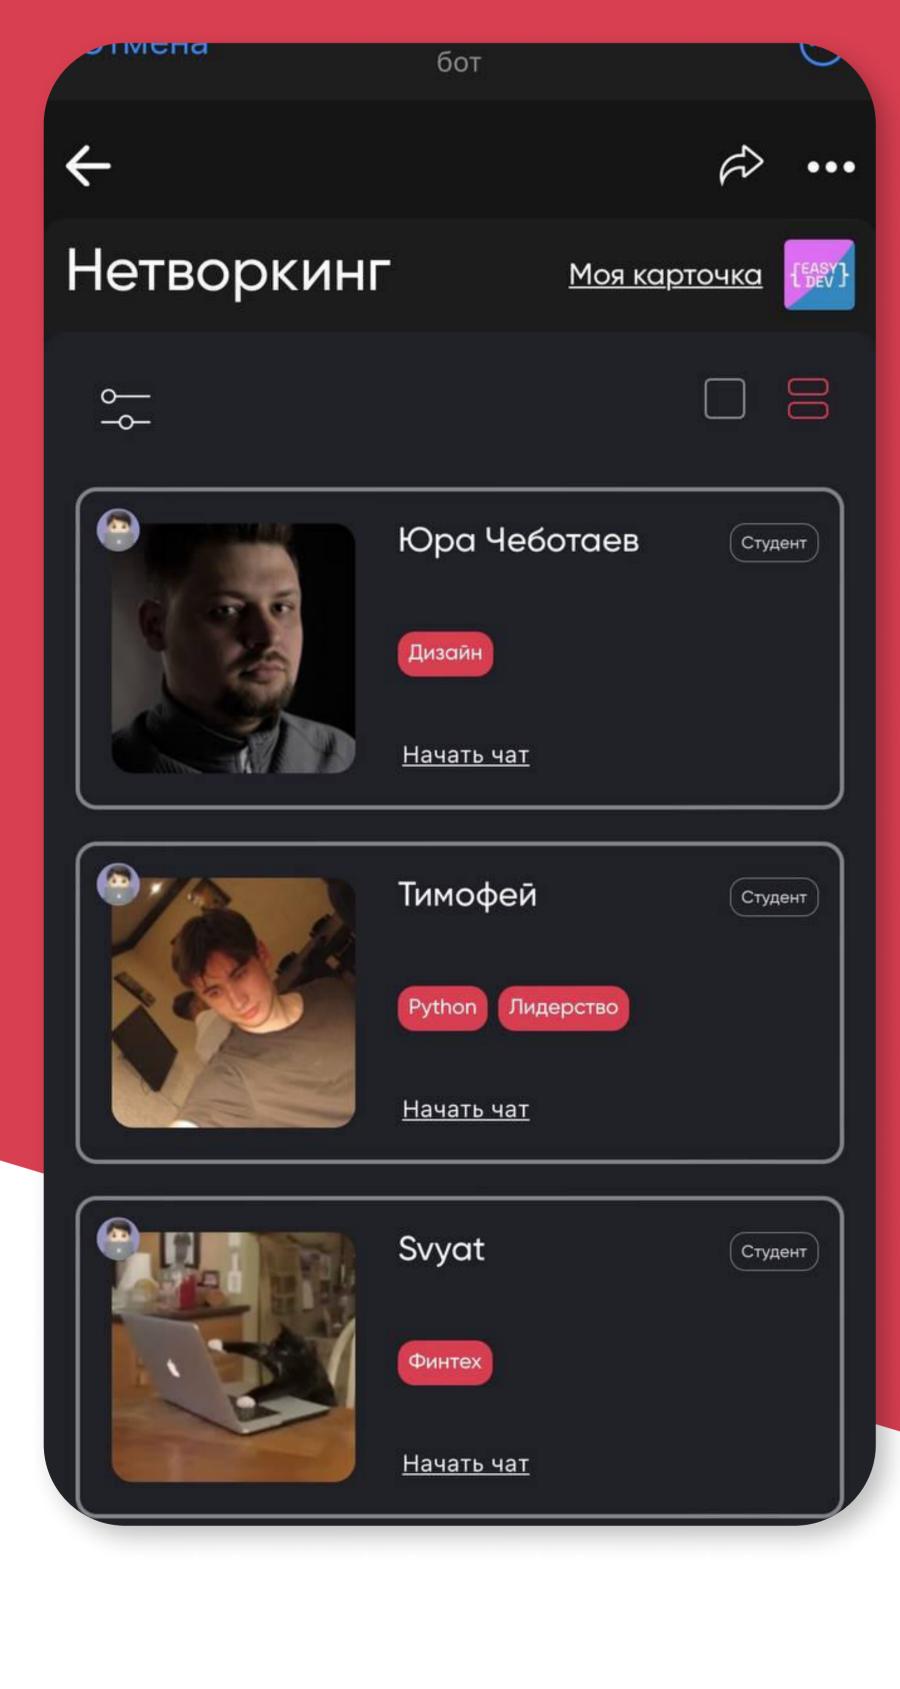

In the application, each participant has the opportunity to post his article, which is moderated and then automatically uploaded to the channel. Each article has a rating: views and reactions in the channel. The bot looks through all the articles every 30 minutes and collects statistics, with the help of which a leaderboard is built from the participants who scored the most reactions and views in total on all its articles.

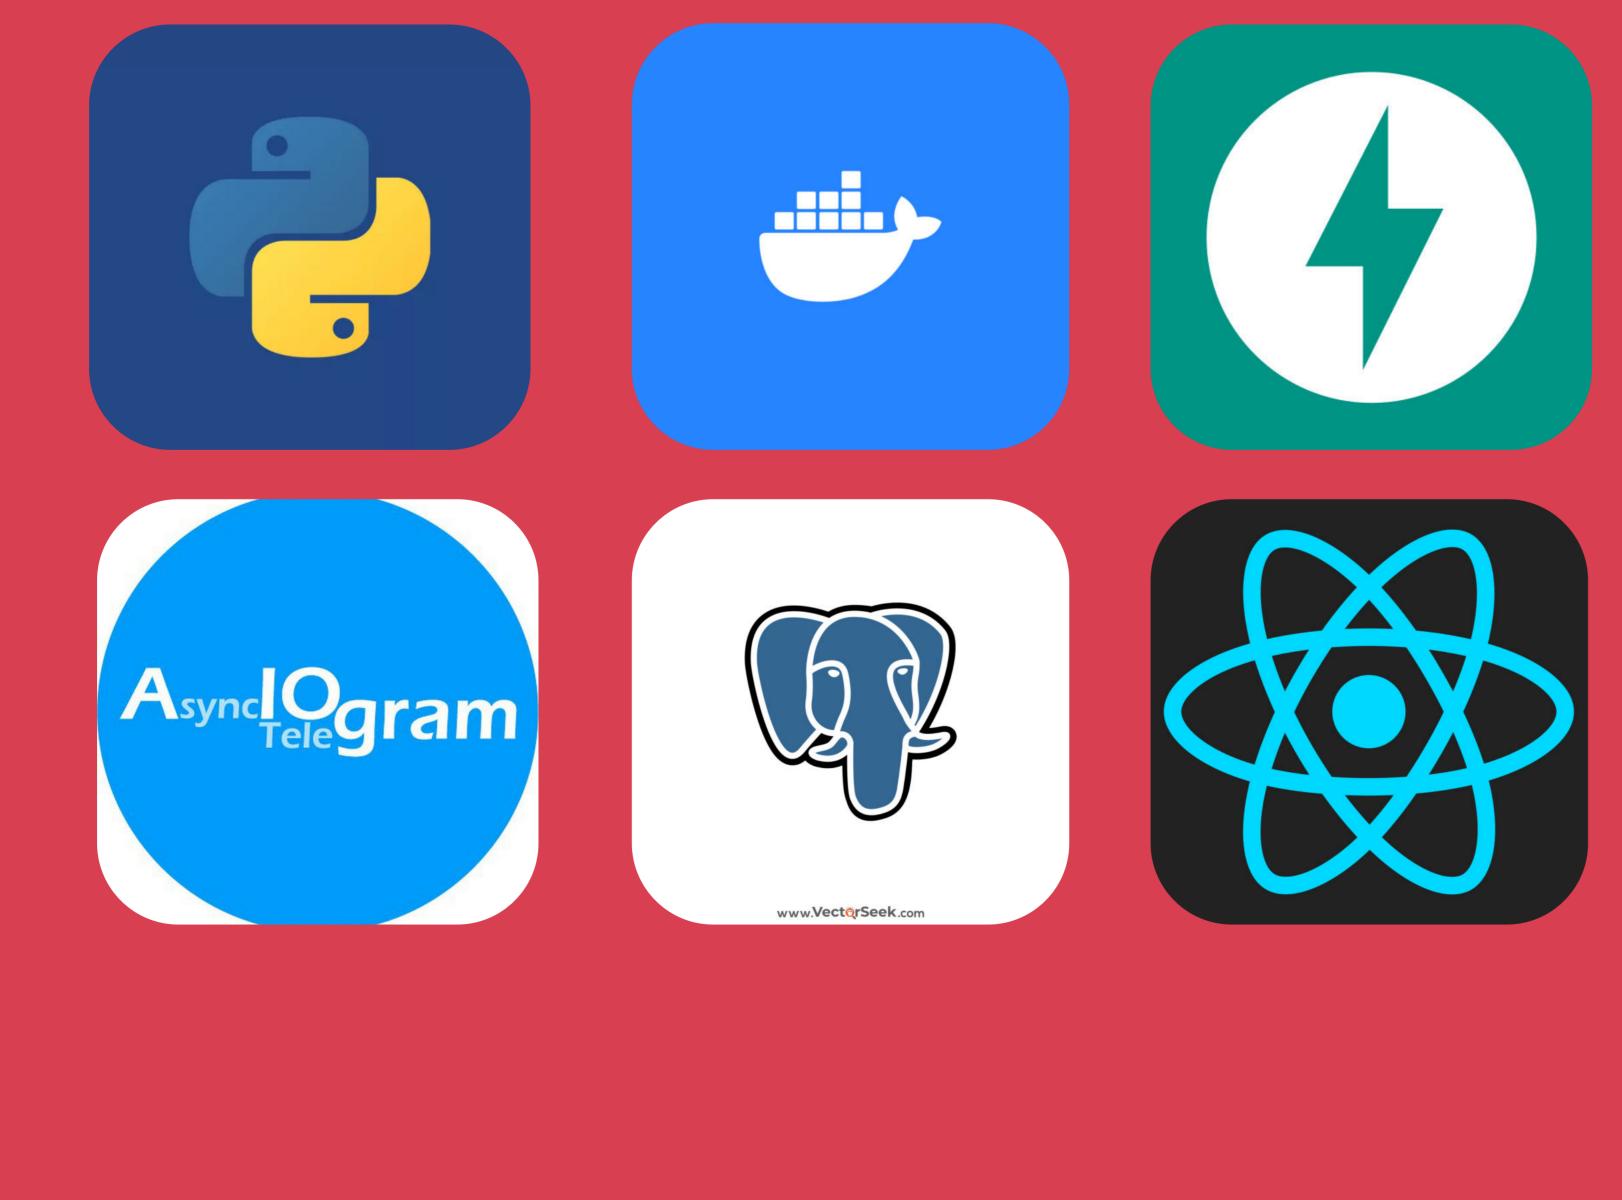

The MOOVE section publishes information and articles from mentors.

Networking or Tinder for startups. In it, the participant forms his specialist card and with the help of filters can find a colleague, mentor, investor for his future projects.

In addition to the entire application, an administrative panel has been implemented, in which you can conveniently monitor all processes at once.

## Project technology stack:

Back-end:

Front-end:

- Python
- FastApi
- Postgresql Celery
- JavaScript React

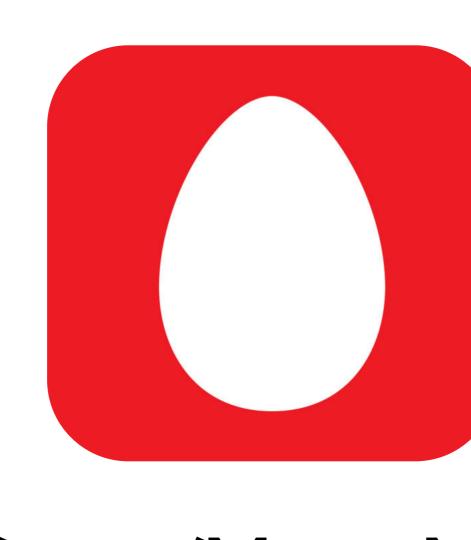

•HTML5

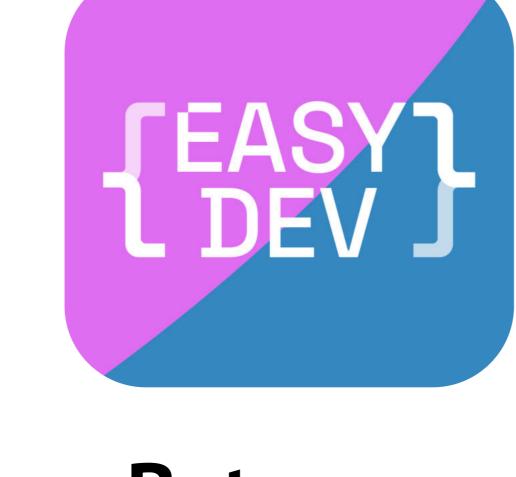

•CSS

- •Flask-admin
- Telethon Telegraph
- Aiogram
- Docker Docker-compose
- Dependency-injector
